

**New Nucleotide Sequences Coding for the thrE Gene and
Process for the Enzymatic Production of L-threonine using
Coryneform Bacteria**

Patent Claims

- 5 1. Preferably recombinant DNA derived from Corynebacterium
and replicable in coryneform microorganisms, which
contains at least one nucleotide sequence that codes
for the thrE gene.
2. Replicable DNA according to claim 1 with
- 10 (i) the nucleotide sequences shown in SEQ-ID-No. 1,
or SEQ-ID No. 3, which code for the thrE gene,
or
- (ii) at least once sequence that corresponds to the
sequences (i) within the degeneration region of
- 15 (iii) at least once sequence that hybridises with the
sequences complementary to the sequences (i) or
(ii), and/or optionally
- (iv) functionally neutral sense mutations in (i).
- 20 3. Amino acid sequence of the protein, derived from the
nucleotide sequences according to claim 1 or 2, shown
in SEQ-ID-No. 2 and in SEQ-ID-No. 4.
4. Coryneforme microorganisms, in particular of the genus
Corynebacterium, transformed by the introduction of one
- 25 or more of the replicable DNA according to claim 1 or
2.
5. Corynebacterium glutamicum DM368-2 pZ1thrE, filed under
Number DSM 12840.
6. Process for producing L-threonine by fermentation of
- 30 coryneform bacteria, characterised in that bacteria are
used in which nucleotide sequences coding for the thrE

099551-0930
T0260-12563660

gene are amplified, and in particular are overexpressed.

7. Process according to claim 6, characterised in that bacteria are used in which in addition one or more genes of the threonine biosynthesis pathway is/are amplified.
8. Process according to claims 6 and 7, characterised in that a strain transformed with a plasmid vector is used and the plasmid vector carries the nucleotide sequence coding for the thrE gene.
9. Process according to claims 6 and 8, characterised in that the thrE gene is overexpressed in microorganisms that contain further metabolite or antimetabolite resistance mutations.
10. Process according to claims 6 to 9, characterised in that the microorganisms in order to achieve over-expression are fermented in altered culture media, and/or the fermentation conditions are changed.
11. Process according to claims 6 to 10, characterised in that microorganisms are used in which the metabolic pathways that reduce threonine formation are at least partially switched off.
12. Process according to claims 6 to 11, characterised in that microorganisms are used in which in addition to the thrE gene the remaining genes of the metabolic pathway for threonine formation are amplified individually or jointly (overexpressed).
13. Process for producing L-threonine, characterised in that the following steps are carried out:
- a) Fermentation of microorganisms according to one or more of the preceding claims, in which at least the thrE gene is amplified (overexpressed) optionally in combination with further genes,

b) Enrichment of the L-threonine in the medium or in the cells of the microorganisms, and

c) Isolation of the L-threonine.

5 14. Process according to one or more of the preceding claims, characterised in that microorganisms of the genus *Corynebacterium* are used.

10 15. Process for isolating the *thrE* gene, characterised in that mutants, preferably of coryneform bacteria, defective in the *thrE* gene that do not grow or grow only weakly on a nutrient medium containing a threonine-containing oligopeptide are obtained as indicator strains, and

15 a) the *thrE* gene is identified and isolated after establishing a gene bank, or

b) in the case of transposon mutagenesis is selected for the transposon preferably exhibiting resistance to antibiotics, and the *thrE* gene is thereby obtained.
